DECLARATION

We declare that this project work titled "**PRIVLOGEDU: AN INNOVATIVE FRAMEWORK FOR REAL-TIME ENGAGEMENT RECOGNITION IN HYBRID CLASSROOMS USING NON-VISUAL LOG DATA WHILE MAINTAINING PRIVACY.**" is composed by ourselves that the work contain here is our own except where explicitly stated otherwise in the text and that this work has been not submitted for any other degree or professional qualification except as specified.

JONNALAGADDA MAHESH BABU (22471A05F9)

ACKNOWLEDGEMENT

We wish to express our thanks to various personalities who are responsible for the completion of our project. We are extremely thankful to our beloved chairman, **Sri M. V. Koteswara Rao, B.Sc.**, who took keen interest in us in every effort throughout this course. We owe our sincere gratitude to our beloved principal, **Dr. S. Venkateswarlu, Ph.D.**, for showing his kind attention and valuable guidance throughout the course.

We express our deep-felt gratitude towards **Dr. S. N. Tirumala Rao, M.Tech., Ph.D.**, HOD of the CSE department, and also to our guide, **Dr. S. N. Tirumala Rao, M.Tech., Ph.D.**, Professor & HOD of the CSE department, whose valuable guidance and unstinting encouragement enabled us to accomplish our project successfully in time.

We extend our sincere thanks to **D. Venkat Reddy, B.Tech., M.Tech., (Ph.D.)**, Assistant Professor & Project Coordinator of the project, for extending her encouragement. Their profound knowledge and willingness have been a constant source of inspiration for us throughout this project work.

We extend our sincere thanks to all the other teaching and non-teaching staff in the department for their cooperation and encouragement during our B.Tech. degree.

We have no words to acknowledge the warm affection, constant inspiration, and encouragement that we received from our parents.

We affectionately acknowledge the encouragement received from our friends and those who were involved in giving valuable suggestions and clarifying our doubts, which really helped us in successfully completing our project.

JONNALAGADDA MAHESH BABU (22471A05F9)

INSTITUTE VISION AND MISSION

INSTITUTION VISION

To emerge as a Centre of excellence in technical education with a blend of effective student centric teaching learning practices as well as research for the transformation of lives and community.

INSTITUTION MISSION

M1: Provide the best class infra-structure to explore the field of engineering and research

M2: Build a passionate and a determined team of faculty with student centric teaching, imbining experiential, innovative skills

M3: Imbibe lifelong learning skills, entrepreneurial skills and ethical values in students for addressing societal problems

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

VISION OF THE DEPARTMENT

To become a center of excellence in nurturing the quality Computer Science & Engineering professionals embedded with software knowledge, aptitude for research and ethical values to cater to the needs of industry and society.

MISSION OF THE DEPARTMENT

The department of Computer Science and Engineering is committed to

M1: Mould the students to become Software Professionals, Researchers and Entrepreneurs by providing advanced laboratories.

M2: Impart high quality professional training to get expertize in modern software tools and technologies to cater to the real time requirements of the Industry.

M3: Inculcate team work and lifelong learning among students with a sense of societal and ethical responsibilities.

Program Specific Outcomes (PSO's)

PSO1: Apply mathematical and scientific skills in numerous areas of Computer Science and Engineering to design and develop software-based systems.

PSO2: Acquaint module knowledge on emerging trends of the modern era in Computer Science and Engineering

PSO3: Promote novel applications that meet the needs of entrepreneur, environmental and social issues.

Program Educational Objectives (PEO's)

The graduates of the programme are able to:

PEO1: Apply the knowledge of Mathematics, Science and Engineering fundamentals to identify and solve Computer Science and Engineering problems.

PEO2: Use various software tools and technologies to solve problems related to the academia, industry and society.

PEO3: Work with ethical and moral values in the multi-disciplinary teams and can communicate effectively among team members with continuous learning.

PEO4: Pursue higher studies and develop their career in software industry.

Program Outcomes

PO1: Engineering knowledge: Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.

PO2: Problem analysis: Identify, formulate, research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.

PO3: Design/development of solutions: Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.

PO4: Conduct investigations of complex problems: Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.

PO5: Modern tool usage: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.

PO6: The engineer and society: Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.

PO7: Environment and sustainability: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.

PO8: Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.

PO9: Individual and team work: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.

PO10: Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.

PO11: Project management and finance: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.

Project Course Outcomes (CO'S):

CO421.1: Analyse the System of Examinations and identify the problem.

CO421.2: Identify and classify the requirements.

CO421.3: Review the Related Literature

CO421.4: Design and Modularize the project

CO421.5: Construct, Integrate, Test and Implement the Project.

CO421.6: Prepare the project Documentation and present the Report using appropriate method.

Course Outcomes – Program Outcomes mapping

Project mapping with various courses of Curriculum with Attained PO's:

Name of the course from which principles are applied in this project	Description of the device	Attained PO
C2204.2, C22L3.2	Gathering the requirements and defining the problem, plan to develop model for detection and classification of Brain Tumor in MRI Scans using CNN-SVM model	PO1, PO3, PO8
CC421.1, C2204.3, C22L3.2	Each and every requirement is critically analyzed, the process model is identified	PO2, PO3, PO8
CC421.2, C2204.2, C22L3.3	Logical design is done by using the unified modelling language which involves individual team work	PO3, PO5, PO9, PO8
CC421.3, C2204.3, C22L3.2	Each and every module is tested, integrated, and evaluated in our project	PO1, PO5, PO8
CC421.4, C2204.4, C22L3.2	Documentation is done by all our four members in the form of a group	PO10, PO8
CC421.5, C2204.2, C22L3.3	Each and every phase of the work in group is presented periodically	PO8, PO10, PO11
C2202.2, C2203.3, C1206.3, C3204.3, C4110.2	Implementation is done and the project will be handled by the social media users and in future updates in our project can be done based on detection for Brain Tumor	PO4, PO7, PO8
C32SC4.3	The physical design includes website to check Brain tumor in MRI scans	PO5, PO6, PO8

ABSTRACT

A Educational reform in the digital learning age increasingly calls for systems not only to track but also to amplify student participation in blended-classroom settings. Toward United Nations Sustainable Development Goal (SDG) 4: Quality Education, this work presents PrivLogEdu, a novel method for real-time engagement detection from non-visual log data with high prediction accuracy and strong privacy protection. Differing from vision-based emotion detection methods that pose privacy and deployment issues, PrivLogEdu leverages behavioral and temporal learning logs problem-solving sequences, time-on task, and skill-switching patterns to infer levels of engagement without recording personally identifiable visual information. The suggested approach makes use of a multi-stage pipeline: data preprocessing, sophisticated feature engineering, Skill2Vec based embedding extraction, and a GRU-attention deep neural architecture tailored for sequence modeling. This architecture allows the system to learn temporal dependencies, pay attention to important behavioral features, and provide engagement classification at three levels (low, moderate, high) with an accuracy of 99.91% on the EdNet-KT1 dataset. Additionally, the model uses class balancing, label smoothing, and threshold tuning to ensure strong generalization and low misclassification. Experiment assessment proves to be more effective compared to traditional engagement recognition models, with near-optimal F1-scores and slight computational costs that are acceptable for real-time utilization. Comparative analysis also attests to the fact that PrivLogEdu outperforms baseline LSTM and Transformer models in accuracy and stability. In addition, avoiding visual modalities, the system naturally minimizes ethical, and data protection risks and fits with modern educational policies prioritizing learner privacy. This research not only helps advance AI-based adaptive learning systems but also provides a scalable solution for learning platforms looking to enhance learning outcomes in hybrid and remote environments while maintaining privacy standards.

1.INTRODUCTION

In the era of rapid technological advancement, education has witnessed a transformative shift from conventional classroom teaching to digital and hybrid learning environments. This transition has opened new possibilities for personalized learning, flexible course delivery, and large-scale participation through online platforms. However, it has also introduced significant challenges in monitoring and maintaining learner engagement, which remains a critical factor influencing academic success, motivation, and retention. Engagement, encompassing behavioral, emotional, and cognitive dimensions, serves as a direct reflection of how actively and meaningfully students participate in learning activities. Ensuring sustained engagement has therefore become one of the primary objectives of modern educational systems.

Traditional engagement detection methods have primarily relied on visual cues such as facial expressions, gaze tracking, head posture, or body movements captured through cameras and sensors. Although these approaches provide detailed behavioral insights, they raise several privacy and ethical concerns. Continuous visual surveillance can lead to discomfort among learners, limit classroom inclusivity, and potentially violate data protection norms. Moreover, such systems are expensive to implement and perform poorly in uncontrolled lighting conditions or when facial features are occluded. Consequently, there is a growing need for non-intrusive, privacy-preserving solutions that can measure engagement objectively without visual or biometric data.

Recent advances in educational data mining (EDM) and artificial intelligence (AI) have enabled the use of learner interaction logs—such as clickstreams, response times, problem-solving sequences, and skill transitions—to infer engagement levels effectively. These log-based features, collected routinely from digital learning platforms, provide a rich source of behavioral information while preserving anonymity. Machine learning algorithms can capture hidden patterns in these temporal sequences, revealing how students interact with educational content and how their engagement evolves over time. This approach not only eliminates privacy risks but also scales efficiently across institutions.

The present work introduces PrivLogEdu, an end-to-end, privacy-preserving engagement recognition framework designed for hybrid and digital classrooms. The system leverages behavioral logs to predict engagement categories—low, moderate, and high—without relying on visual data. It employs a structured data processing pipeline encompassing feature engineering, Skill2Vec embedding generation, and a Gated Recurrent Unit (GRU) model enhanced with an attention mechanism to capture temporal dependencies and contextual relationships between learning skills. The model achieves high interpretability and near real-time prediction capabilities, offering educators actionable insights into student participation levels.

In parallel with the growth of online and hybrid learning systems, educational platforms have begun generating vast volumes of fine-grained learner data. Every interaction such as transitioning between skills creates a digital footprint that reflects the learner’s study behavior. When analyzed systematically, such data can reveal patterns of persistence, hesitation, mastery, or disengagement that are otherwise difficult to observe in traditional classrooms.

Furthermore, engagement is inherently dynamic rather than static, fluctuating across time, topics, and learning contexts. Static evaluation methods or one-time assessments fail to capture these temporal variations, often leading to delayed or inaccurate interventions. This temporal perspective is essential for adaptive education, where timely feedback and personalized support can significantly enhance learning outcomes. As a result, sequence-aware analytical models are increasingly recognized as a powerful tool for understanding and supporting learner engagement in modern educational environments.

By integrating log-based analytics with sequence learning, PrivLogEdu bridges the gap between accuracy and ethical responsibility in educational AI. It contributes to the broader goal of achieving inclusive, transparent, and sustainable learning environments aligned with the principles of UN Sustainable Development Goal 4 – Quality Education. The framework sets a new direction for data-driven engagement analysis, ensuring that the benefits of technology-enhanced learning are realized without compromising privacy or fairness.

1.1 Motivation

Sustaining student engagement—especially in blended or large-enrollment courses—is a persistent pedagogical challenge. Manual monitoring is laborious and subjective; camera-based automated systems, while accurate in some contexts, create privacy, cost, and ethical barriers that prevent broad institutional adoption. Log-based engagement models present a compelling alternative: they are inherently non-visual, scale easily across platforms, and reuse data that learning platforms already collect (timestamps, problem IDs, correctness, time-on-task, skill IDs). Empirical studies show that properly engineered temporal features from interaction logs correlate strongly with engagement and performance; leveraging sequence models that capture temporal dependencies can turn these logs into actionable, privacy-aware engagement signals. The **PrivLogEdu** framework was designed to take advantage of these strengths improving instructor situational awareness and enabling adaptive pedagogic interventions while aligning with data-protection norms and institutional privacy policies.

In addition, the growing availability of large-scale educational datasets such as **EdNet-KT1** provides an unprecedented opportunity to apply machine learning for understanding student behavior at scale. Yet, most institutions underutilize these logs for engagement analytics due to the absence of standardized frameworks and interpretable AI models. The motivation behind **PrivLogEdu** is to create an intelligent, transparent, and ethically grounded system that translates raw learner interaction data into meaningful engagement insights. By combining *Skill2Vec* embeddings with the GRU–Attention architecture, the framework captures both the semantic and temporal dimensions of learning. This allows educators and administrators to make informed decisions, tailor instruction dynamically, and identify students who may need additional support—all while maintaining data privacy. Ultimately, PrivLogEdu is motivated by the vision of empowering educational institutions with AI-driven tools that enhance learning quality without compromising trust or ethics.

1.2 Problem Statement

Most existing automated engagement detection systems fall into one of two problematic categories: (a) visual/modal solutions that require cameras and produce privacy risks (and sometimes degrade under poor lighting or occlusion), or (b) simple statistical models that ignore temporal structure and therefore fail to capture nuanced engagement dynamics. Moreover, many log-based approaches reported in the literature either underutilize sequence modeling or lack the feature engineering needed for robust real-time inference across heterogeneous learners and sessions. The central problem this project tackles is:

How can we accurately and reliably infer multi-class student engagement (low, moderate, high) in hybrid classroom settings using only non-visual interaction logs, while ensuring privacy, scalability, and suitability for real-time pedagogical feedback?

These limitations highlight a broader gap between methodological capability and practical classroom deployment. While privacy-preserving log data is widely available in learning management systems, its full potential for engagement recognition remains underexplored due to fragmented modeling strategies and inconsistent representations of learner behavior. In particular, the absence of unified frameworks that combine rich behavioral feature engineering with temporal. Without an integrated approach, existing systems struggle to adapt across diverse learners, subjects, and instructional settings, limiting their usefulness for actionable, real-time educational interventions.

Addressing this problem requires (i) a careful preprocessing pipeline for high-volume educational logs, (ii) engineered session-level and sequence features that capture behavior and skill transitions, (iii) semantic embeddings for skills (Skill2Vec) to represent latent relationships, and (iv) an efficient sequence model with attention that can be deployed in near real time. PrivLogEdu implements and evaluates this full pipeline on a large-scale learning dataset to demonstrate feasibility and strong predictive performance.

1.3 Objective

The first objective of this work is to design and systematically describe a fully privacy-preserving student engagement recognition pipeline that operates exclusively on non-visual learner interaction logs. This includes a detailed exposition of data preprocessing strategies for high-volume educational logs, robust feature engineering techniques, construction of semantic skill embeddings, and the overall model architecture. In addition, the objective emphasizes deployment considerations, ensuring that the proposed framework is scalable, ethical, and suitable for real-time or near real-time classroom environments without compromising learner privacy.

The second objective focuses on the practical implementation and empirical evaluation of a sequence-based learning model for engagement classification. Specifically, the work employs a Gated Recurrent Unit (GRU) architecture enhanced with an attention mechanism, combined with Skill2Vec embeddings and session-level statistical features. Through experimentation on representative large-scale educational datasets such as EdNet-KT1, the objective is to demonstrate reliable and robust multi-class engagement prediction across low, moderate, and high engagement levels.

The third objective is to conduct a comparative analysis between the proposed framework and commonly used baseline architectures, including Long Short-Term Memory (LSTM) networks, vanilla GRU models, and Transformer-based variants. This comparison is aimed at justifying the design choices by evaluating performance metrics such as classification accuracy, computational and inference costs, and privacy implications. By doing so, the study highlights the effectiveness of the proposed approach in balancing predictive performance, efficiency, and ethical responsibility.

2.LITERATURE SURVEY

The evolution of **Artificial Intelligence (AI)** and **data analytics** in education has significantly transformed how educators assess, understand, and enhance student learning experiences. Over the past decade, the integration of AI-driven models and learning analytics has led to new possibilities for personalized education, adaptive assessment, and data-informed teaching strategies. Traditional classroom observation and visual monitoring methods have gradually given way to automated systems that analyze large volumes of learner interaction data, providing more objective and scalable insights into student engagement. Recent studies emphasize that engagement, being a multidimensional construct encompassing behavioral, cognitive, and affective components, can be effectively measured through learners' digital footprints. In this context, educational data mining and machine learning have emerged as powerful tools for converting raw data into meaningful interpretations of student behavior and motivation.

Researchers such as Kumar et al. and Li et al. have highlighted the growing significance of **privacy-preserving engagement detection**, especially in the wake of ethical concerns associated with facial recognition and surveillance-based systems. Camera-based engagement models, although capable of detecting attention or emotion through facial expressions and posture, face major limitations such as lighting sensitivity, cost of setup, cultural bias, and privacy violations. To overcome these challenges, contemporary research has shifted toward **log-based analytics**, which rely on system-generated behavioral records like clickstreams, timestamps, problem attempts, and accuracy scores. Studies in IEEE Transactions on Learning Technologies and Computers & Education have shown that log-derived features such as session duration, time per question, and correctness ratio exhibit strong correlations with engagement levels. These methods are not only non-intrusive but also more scalable for deployment in diverse educational contexts.

Several frameworks have contributed foundational ideas to this field. For instance, **An Iterative Data-Driven Intelligent Multiple-Attribute Decision-Making Model for Football Teaching Quality Assessment (2023)** demonstrated how multi-attribute evaluation and iterative optimization can be used to assess teaching

performance quantitatively. **Analyzing Classroom Interaction Data Using AI Models (2024)** explored multimodal engagement recognition but also acknowledged privacy and deployment challenges inherent in video-based systems. **The Application of Artificial Intelligence in Engineering Education: A Systematic Review (2024)** further emphasized the role of deep learning models in improving personalized instruction, while **Enhancing Student Engagement and Performance with Artificial Intelligence (2024)** discussed how intelligent tutoring systems can leverage behavioral feedback to maintain learner focus. Similarly, **Competency-Based Hybrid Learning: A Modern Approach to Teaching Programming and Digital Technologies (2023)** introduced adaptive, skill-driven analytics that align closely with PrivLogEdu’s use of Skill2Vec embeddings to model conceptual relationships between skills.

Despite these advancements, gaps remain in developing models that ensure both **accuracy and ethical compliance**. Many existing approaches focus on achieving high prediction performance but neglect interpretability and privacy preservation. PrivLogEdu addresses these limitations by combining feature-rich behavioral logs with temporal deep learning architectures—specifically, the **Gated Recurrent Unit (GRU)** enhanced by an **attention mechanism**. This design allows the model to capture sequential dependencies and assign dynamic importance to key learning moments while maintaining strict non-visual data usage. The framework’s strength lies in transforming standard educational logs into structured, meaningful features that can be used for engagement recognition across different contexts and institutions. Thus, through the synthesis of ideas from prior research and the application of ethical AI practices, PrivLogEdu establishes itself as a next-generation model that bridges the gap between technological innovation, interpretability, and educational inclusivity.

2.1 Review of Existing Research

An Iterative Data-Driven Intelligent Multiple-Attribute Decision-Making for Football Teaching Quality Assessment.

This study presented a systematic approach to analyzing educational performance using an iterative data-driven decision model. It emphasized **multi-attribute evaluation**, highlighting that educational quality assessment requires a balance

between performance metrics and behavioral indicators. The methodology from M1 inspired the **multi-parameter log-based feature extraction** component in PrivLogEdu, which evaluates engagement based on diverse behavioral attributes such as accuracy, time-on-task, and skill transitions.

Analyzing Classroom Interaction Data Using AI Models.

Paper focused on **classroom interaction analysis** using audio-visual data, revealing how student–teacher interactions affect engagement and learning outcomes. Although effective, it raised concerns about **privacy and scalability**, as visual data capture is intrusive and not suitable for large-scale adoption. PrivLogEdu builds upon this limitation by shifting from **visual to non-visual modalities**, utilizing interaction logs to infer engagement while ensuring privacy protection.

The Application of Artificial Intelligence in Engineering Education - A Systematic Review.

Paper provided a comprehensive overview of how AI applications—particularly deep learning—enhance **personalized learning and adaptive systems**. It outlined frameworks for integrating AI into learning management systems (LMS) for **predictive analytics** and **student profiling**. PrivLogEdu extends these principles to focus specifically on **engagement prediction** using AI models that learn temporal patterns through GRU with attention mechanisms.

Enhancing Student Engagement and Performance with Artificial Intelligence.

Paper explored how intelligent systems can enhance engagement through **real-time monitoring and adaptive content delivery**. It validated that engagement directly influences academic performance and can be effectively predicted from interaction behaviors. The proposed PrivLogEdu framework inherits these insights, focusing on log-based behavioral sequences to **quantify engagement levels** without using cameras.

Competency-Based Hybrid Learning — A Modern Approach to Teaching Programming and Digital Technologies.

This paper emphasized competency-based hybrid learning frameworks that combine digital technologies and adaptive assessment. It introduced the concept of **skill-based learning analytics**, where each student’s skill proficiency and transition

rate can be modeled computationally. PrivLogEdu incorporates a similar **Skill2Vec embedding approach**, allowing the model to understand relationships between different skill identifiers in the dataset.

Base Paper Dataset and Framework Reference.

The dataset outlined in P0 served as the initial reference for PrivLogEdu’s development. It defined the key parameters—**student_id, problem_id, time_taken, skill_id, correctness, and timestamp**—which became the foundation for all preprocessing, feature extraction, and model training stages.

2.2 Insights from Prior Work

From the review of literature, the following gaps and inspirations were identified:

1. Most prior works depend on visual or multimodal data that compromise privacy.
2. Few systems integrate **sequence learning** and **skill-level embeddings**.
3. There is a lack of a **unified, privacy-preserving engagement framework** that can generalize across large datasets.
4. AI-based decision systems show the potential of feature-driven prediction models but lack application in **real-time engagement monitoring**.

PrivLogEdu addresses these issues by employing **log-only data**, introducing a **Skill2Vec-based embedding layer**, and applying **GRU + Attention** for sequential feature learning. It bridges the theoretical and practical gaps by combining educational data mining with privacy-focused machine learning techniques.

2.3 Visualization of Related Works

Below presents an integrated flow diagram that summarizes the research evolution from traditional AI-based education models to the privacy-preserving engagement recognition proposed in PrivLogEdu.

Additionally, depict sample feature analyses and engagement distributions derived from interaction logs.

These visualizations highlight how behavioral features such as average time taken, skill switch rate, and correctness ratios influence engagement levels.

Fig 2.1: Dataset feature relationships including skill IDs.

2.4 Summary

The literature survey concludes that while AI and machine learning have been effectively integrated into education for performance assessment and personalization, the **dimension of privacy-preserving engagement analytics** remains underexplored. PrivLogEdu emerges as a **comprehensive solution** that unites:

- The statistical rigor of decision-making models (M1).
- The engagement focus of AI-based classroom analytics (M4, M6).
- The adaptivity of hybrid and skill-based learning systems (M10).
- By combining **log-based behavioral data**, **Skill2Vec embeddings**, and **attention-based sequence learning**, the framework ensures accurate, scalable, and ethically responsible engagement prediction.

3. SYSTEM ANALYSIS

The analysis of the system involves a comprehensive understanding of existing engagement detection approaches, the identification of their limitations, and the design of an innovative system capable of addressing these barriers effectively. In educational research and technology-enhanced learning, analyzing student engagement has long been a focal challenge because engagement is not a directly observable construct. It must instead be inferred from patterns in student behavior, performance metrics, and cognitive responses. Traditional systems have relied heavily on manual observation or visual analytics—techniques that, while insightful, struggle to scale and raise significant privacy concerns in modern classrooms. These limitations highlight the need for data-driven solutions that ensure both efficiency and ethical responsibility.

The **PrivLogEdu** framework represents a major advancement in this direction. It introduces a privacy-preserving and intelligent methodology to monitor engagement through behavioral log data rather than visual information. The system applies advanced machine learning and sequence modeling techniques to analyze student interactions with digital learning platforms in real time. By incorporating **Skill2Vec embeddings** and a **GRU-Attention architecture**, PrivLogEdu learns both temporal and contextual dependencies between learning activities, providing an interpretable and highly accurate engagement prediction mechanism. This allows educators to identify disengaged learners early and implement personalized interventions that improve academic outcomes.

A thorough system analysis is vital to understand the conceptual and practical evolution from existing visual-based systems to this non-visual, privacy-centric solution. The analysis examines how earlier frameworks approached engagement recognition, where they fell short, and how the proposed design resolves these limitations through optimized data preprocessing, robust feature engineering, and a modular architecture. Additionally, this section explores the **feasibility, scalability, and implementation cost** of PrivLogEdu using software engineering estimation models such as **COCOMO**, ensuring that the framework is not only technically viable but also economically and operationally sustainable.

In summary, system analysis serves as the foundation upon which the design and implementation of PrivLogEdu are built. It provides a structured understanding of the transition from traditional engagement detection mechanisms to the proposed intelligent, log-based approach. Through this analytical lens, the study establishes PrivLogEdu as an ethically responsible, computationally efficient, and practically deployable model for engagement monitoring in hybrid and digital classrooms, setting the stage for the detailed exploration of its subsystems in the subsequent sections.

3.1 EXISTING SYSTEM

Over the past decade, engagement detection in educational environments has been heavily dependent on **visual-based models** that analyze facial expressions, posture, and eye movement using cameras or wearable sensors. Systems based on convolutional neural networks (CNNs), deep facial emotion recognition, or multi-modal audiovisual fusion have shown acceptable levels of accuracy in predicting attention and affective states. For instance, research such as “*Analyzing Classroom Interaction Data Using Artificial Intelligence Models*” has demonstrated the use of camera-based interaction recording to classify low, medium, and high engagement levels from visual cues. Similarly, hybrid frameworks have integrated eye-gaze and gesture recognition into adaptive learning systems to provide real-time attention monitoring.

However, these methods depend heavily on data collection through **video cameras, microphones, and wearable sensors**, all of which pose severe **privacy, ethical, and logistical challenges**. Many of these systems require controlled environments with high-quality recording conditions to function correctly. Moreover, visual-based recognition is susceptible to **lighting variations, occlusions, and cultural expression differences**, which limit generalization across diverse student populations.

In addition to these limitations, existing engagement detection systems are often constrained by **binary classification models**, which classify students as simply “engaged” or “not engaged.” Such reductionist approaches overlook the complexity and gradation of human learning behavior. They also lack real-time adaptability and scalability across platforms, making deployment in large-scale or hybrid learning environments impractical.

Thus, while these legacy systems offered foundational insights into engagement analytics, they are **not sustainable** for privacy-preserving, large-scale, or ethically compliant educational infrastructures envisioned under **Sustainable Development Goal (SDG) 4: Quality Education**.

3.1.1 DISADVANTAGES OF THE EXISTING SYSTEM

The disadvantages of the existing engagement recognition systems are multi-dimensional, spanning technical, ethical, and operational domains:

1. **Privacy Concerns:**

The collection and processing of facial and video data intrude upon student privacy and often violate institutional or governmental data protection regulations. Many visual systems fail to comply with privacy norms such as GDPR or national education data guidelines.

2. **High Infrastructure Cost:**

Setting up multi-camera systems, maintaining high-resolution recording, and storing massive video data involve considerable computational and financial resources, which limit scalability in rural and underfunded institutions.

3. **Environmental Sensitivity:**

Accuracy in camera-based models deteriorates under variable lighting, camera angles, or occlusions, leading to inconsistent recognition results across real-world classroom conditions.

4. **Limited Generalization:**

Models trained on specific cohorts or demographic groups may not perform well across diverse cultural and behavioral contexts, leading to biased engagement predictions.

5. **Lack of Real-Time Feedback:**

Many visual and multimodal frameworks process data offline, thus failing to provide instantaneous feedback to educators during ongoing sessions.

6. **Ethical and Psychological Issues:**

Continuous surveillance can induce discomfort or anxiety among learners, thereby affecting their natural behavior and distorting engagement indicators.

These limitations highlight the need for a **non-intrusive, scalable, and ethically compliant solution** that maintains accuracy while completely avoiding visual modalities.

3.2 PROPOSED SYSTEM

To overcome the shortcomings of the traditional systems, the **PrivLogEdu** framework introduces an **innovative privacy-preserving model** that uses **non-visual log data** to predict student engagement levels in real time. The system leverages behavioral, temporal, and cognitive patterns recorded during interaction with digital learning platforms, eliminating the need for video or biometric data.

The proposed pipeline is structured into several key stages:

1. **Data Preprocessing:**

Raw interaction logs from the EdNet-KT1 dataset undergo cleaning, session segmentation, and normalization. Sessions are defined based on 30 minutes of inactivity, ensuring accurate modeling of learning intervals. Outlier removal and data standardization stabilize the learning process and reduce noise.

2. **Feature Engineering and Embedding:**

Features such as *average time per question*, *session accuracy*, *burstiness*, *skill-switch rate*, and *session duration* are derived from log data. In addition, **Skill2Vec embeddings** a semantic representation inspired by Word2Vec—encode relationships between skill identifiers, allowing the model to capture contextual and cognitive dependencies among learning skills.

3. **Feature Selection:**

Correlation analysis and Recursive Feature Elimination (RFE) are applied to retain only the most discriminative features. This minimizes overfitting and ensures high efficiency in the model training phase.

4. **Model Architecture (GRU + Attention):**

The heart of PrivLogEdu is a **Gated Recurrent Unit (GRU)** architecture integrated with an **Attention mechanism**. GRU layers effectively capture temporal dependencies in student behavior, while attention dynamically focuses on recent or influential actions relevant to engagement prediction.

5. Classification and Output:

The final classification layer categorizes engagement into **three levels** — **low, moderate, and high** — using SoftMax activation. The system achieves a classification accuracy of **99.91%** on the EdNet-KT1 dataset, surpassing traditional models like LSTM and Transformers.

6. Privacy and Ethical Compliance:

As no visual or personal data are collected, the model ensures **complete data anonymity** and complies with institutional data protection frameworks, aligning with SDG Goal 4 for equitable and ethical education.

This structure allows **real-time inference**, minimal computational expense, and seamless integration with existing learning management systems (LMS). Furthermore, the framework is adaptable across K–12 and higher-education environments, ensuring generalizability and inclusivity.

3.3 FEASIBILITY STUDY

A detailed feasibility analysis was conducted to assess the technical, operational, and economic viability of the PrivLogEdu framework.

Technical Feasibility

PrivLogEdu is built using Python (TensorFlow/Keras) with the GRU-Attention model, Skill2Vec embeddings, and data preprocessing in Pandas and NumPy. The system is fully deployable on cloud-based environments like Google Colab or institutional servers. The modular design allows for future updates such as federated learning integration or multimodal log inclusion. The preprocessing pipeline and model inference are computationally light, enabling deployment on standard hardware with 8 GB RAM and a mid-range GPU. Thus, the system demonstrates strong scalability and reliability for educational institutions of varying capacities.

Operational Feasibility

Operationally, PrivLogEdu integrates effortlessly with LMSs that already collect interaction logs (timestamps, skill IDs, correctness, etc.). Educators can visualize engagement analytics through intuitive dashboards, receiving real-time insights into learners' attention patterns. The absence of visual monitoring improves student comfort and institutional acceptability. Maintenance requirements are minimal, as retraining can occur periodically with new data batches.

Economic Feasibility

The system is **cost-effective**, as it eliminates the need for expensive camera installations, large storage servers for video data, and dedicated monitoring staff. The model's training cost is limited to computational resources for preprocessing and neural training, which are substantially reduced through the use of batch processing and lightweight GRU networks. In the long term, the automation of engagement assessment reduces manual effort, saving time and operational expenditure for educational organizations.

3.4 USING COCOMO MODEL

The **Constructive Cost Model (COCOMO)** provides an empirical method to estimate project effort, time, and team requirements for software development. Based on the complexity and mixed-experience team structure of this research-oriented AI project, **PrivLogEdu** is categorized under the **Semi-Detached mode** of the COCOMO model.

The following constants are applied:

$$a = 3.0, b = 1.12, c = 2.5, d = 0.35$$

Estimated Code Size (KLOC): 10 (approximately 10,000 lines)

Effort (E):

$$E = 3.0 \times (10)^{1.12} = 39.54 \text{ Person-Months}$$

Development Time (T):

$$T = 2.5 \times (39.54)^{0.35} = 10.58 \text{ Months}$$

People Required (P):

$$P = E / T = 39.54 / 10.58 \approx 4 \text{ Developers}$$

Therefore, the project would optimally require a **team of 4 members**:

One machine learning engineer (model training and optimization)

One backend developer (API and LMS integration)

One data engineer (log preprocessing and feature generation)

One tester/analyst (validation and visualization dashboards)

The total development duration is estimated at approximately **10.5 months**, including data preparation, model development, validation, and system deployment.

The relatively low cost and small team size demonstrate the efficiency and practicality of PrivLogEdu as an academic and institutional AI solution.

Summary

The system analysis establishes that **PrivLogEdu** provides a technically advanced, ethically compliant, and economically feasible solution to one of education's most critical challenges—engagement detection. By shifting from **visual-based surveillance** to **log-based analytics**, it redefines the landscape of intelligent learning systems. The integration of **Skill2Vec embeddings** with **GRU-Attention architecture** offers a robust and interpretable model capable of achieving **99.91% accuracy** while ensuring absolute privacy.

The feasibility study and cost estimation further affirm that this system is ready for deployment in real-world educational environments, aligning perfectly with modern standards of **data ethics, inclusivity, and scalability**.

4. SYSTEM REQUIREMENTS

System requirements specify the necessary hardware, software, and analytical components essential for developing and executing the **PrivLogEdu** framework. As the project involves both machine learning model development and educational data analytics, the requirements were determined with scalability, efficiency, and reproducibility in mind.

4.1 SOFTWARE REQUIREMENTS

The following software stack and development environment were used:

Table 1: Software Stack

Software Component	Description / Purpose
Operating System	Windows 10 / Ubuntu 22.04 LTS — used for code development and execution.
Programming Language	Python 3.10 — primary language for model building, feature engineering, and data analysis.
IDE / Notebook	Google Colab, Jupyter Notebook — used for code execution, model visualization, and experimentation.
Libraries and Frameworks	TensorFlow, Keras, NumPy, Pandas, Matplotlib, Scikit-learn, Seaborn — used for deep learning model construction, preprocessing, data visualization, and evaluation.
Database	MongoDB / CSV Data Files — used to store pre-processed datasets and extracted features.
Version Control	GitHub — for collaborative development and version management.
Documentation Tools	Microsoft Word, LaTeX (for research paper formatting) — used for preparing final reports and publications.

Justification:

This software environment ensures compatibility across systems and provides robust support for deep learning workflows. TensorFlow and Keras facilitate easy implementation of GRU and attention-based architectures, while Pandas and Scikit-learn handle efficient preprocessing and feature scaling.

4.2 REQUIREMENT ANALYSIS

Requirement analysis defines the system functionalities, constraints, and flow between user roles and machine learning components. PrivLogEdu has been designed for high-level **automation, privacy, and accuracy**, aligning with the key objectives of educational data analytics.

Functional Requirements

1. **Data Acquisition Module** — Collects non-visual log data including `student_id`, `problem_id`, `skill_id`, `time_taken`, `correct`, and `timestamp` from digital learning platforms.
2. **Preprocessing Module** — Performs missing value handling, normalization, and session-based segmentation of data.
3. **Feature Engineering** — Computes derived metrics such as average session accuracy, burstiness, and skill-switch rate.
4. **Embedding Generation** — Uses **Skill2Vec** to transform skill identifiers into high-dimensional vectors representing semantic learning relationships.
5. **Model Training** — Employs a GRU network with an attention layer to classify engagement into *Low*, *Moderate*, and *High* categories.
6. **Model Evaluation** — Generates confusion matrices, accuracy, and F1-score graphs to evaluate model performance.
7. **Visualization & Reporting** — Displays engagement trends and system analytics in graphical format.

Non-Functional Requirements

1. **Scalability:** Designed to handle large-scale datasets such as EdNet-KT1 without performance degradation.
2. **Privacy and Security:** Uses anonymized log data to ensure compliance with institutional data governance frameworks.

3. **Maintainability:** Modular code design allows future extension (e.g., integration of federated learning).
4. **Performance:** High inference speed suitable for real-time classroom analysis with minimal computational overhead.
5. **Portability:** Framework deployable across Windows, Linux, and cloud platforms.

4.3 HARDWARE REQUIREMENTS

The hardware configuration was selected to ensure smooth execution of deep learning tasks, visualization, and storage operations.

The system runs efficiently even on moderate computing setups.

Uses Matplotlib and Seaborn for graphical representation of accuracy plots, engagement label distributions, and confusion matrices.

Model Layer:

Contains the GRU-Attention model, hyperparameter configurations, and evaluation scripts integrated through TensorFlow.

This multi-layered architecture enhances reusability, ensures modular upgrades, and simplifies the pipeline for research deployment or industrial adaptation.

4.4 SOFTWARE DESCRIPTION

The **PrivLogEdu** system software integrates machine learning intelligence with data preprocessing and visualization modules to form a seamless privacy-preserving engagement recognition framework.

1. **Programming Language:**

Python was chosen due to its extensive support for machine learning libraries and ease of integration with educational datasets. Its object-oriented design ensures reusability and readability.

2. **Framework:**

TensorFlow and Keras provide GPU acceleration, automatic differentiation, and dynamic model graphing capabilities. They simplify the construction of recurrent networks (GRU) and attention layers used for sequential analysis.

3. **Visualization Tools:**

Matplotlib and Seaborn are utilized for plotting model performance metrics and engagement trends, offering a clear visual interpretation of outcomes.

4. **Data Handling:**

Pandas and NumPy enable efficient data manipulation and numerical computation, facilitating preprocessing for massive datasets.

5. **Version Control & Collaboration:**

GitHub repositories store model checkpoints, scripts, and experiment results for collaborative research and traceability.

6. **Testing and Evaluation:**

Model validation is conducted using Scikit-learn's evaluation utilities, such as confusion matrix generation, accuracy calculation, and F1-score assessment.

7. **Deployment:**

The model can be deployed locally or integrated into Learning Management Systems (LMS) via RESTful APIs, enabling real-time engagement monitoring.

Summary

The defined software and hardware requirements ensure that the **PrivLogEdu** framework operates efficiently across diverse educational and computational environments.

Its open-source software stack, minimal hardware dependencies, and privacy-first design make it an ideal and scalable solution for institutions aiming to implement **AI-powered engagement analytics** responsibly.

The modular architecture further allows continuous research enhancement and integration with upcoming educational technologies.

5. SYSTEM DESIGN

This project System design transforms theoretical concepts into a practical architecture that defines the flow of data, processing logic, and model implementation. The **PrivLogEdu** framework follows a systematic and modular design process to ensure accuracy, scalability, and privacy compliance. It integrates statistical analysis, machine learning, and sequence modeling to classify student engagement levels from non-visual log data.

The design emphasizes two core principles:

1. **Privacy Preservation** — No visual or biometric data are used.
2. **Interpretability and Real-Time Analysis** — The model must explain engagement dynamics and provide feedback efficiently.

5.1 SYSTEM ARCHITECTURE

The system architecture of **PrivLogEdu** is composed of multiple interconnected layers that handle data flow from acquisition to classification. It combines preprocessing, feature engineering, embedding, model training, and classification modules in a well-defined pipeline.

Fig 5.1: Overall Architecture of PrivLogEdu.

Architecture Flow Explanation:

1. **Dataset Acquisition:** Log data is collected from an e-learning platform such as *EdNet-KT1*, containing timestamps, student identifiers, skill IDs, problem IDs, correctness values, and time taken.

2. **Preprocessing Layer:** Data is cleaned, normalized, and grouped into sessions based on inactivity periods.
3. **Feature Engineering:** Statistical and session-based features are computed. Skill embeddings are generated using *Skill2Vec*.
4. **Model Layer (GRU + Attention):** Sequential patterns in learner behavior are learned through Gated Recurrent Units, while the Attention mechanism highlights important temporal dependencies.
5. **Classification Layer:** Engagement level (Disengaged, Moderate, or Highly Engaged) is predicted using a SoftMax output layer.
6. **Evaluation Layer:** Model accuracy, precision, recall, F1-score, and confusion matrix are generated for validation.

This architecture ensures a smooth flow of information, reduced redundancy, and efficient execution.

5.1.1 DATASET

The PrivLogEdu framework utilizes the **EdNet-KT1 dataset**, a large-scale educational log dataset containing millions of student interactions. Each record captures the following attributes

The dataset is purely **log-based and non-visual**, ensuring privacy and ethical compliance. Data imbalance issues were addressed through class rebalancing, and corrupted or null records were removed during preprocessing.

5.1.2 DATA PREPROCESSING

Preprocessing is a critical stage that enhances data quality and prepares it for model training. The steps include:

1. **Data Cleaning:**
 - Removal of missing or invalid entries.
 - Standardization of timestamp formats.
 - Conversion of categorical attributes into numerical labels.
2. **Session Segmentation:**
 - Logs are grouped into sessions based on a 30-minute inactivity threshold.
 - Each session represents a single continuous learning period.
3. **Normalization and Feature Scaling:**
 - Continuous attributes like `time_taken` and `log_delta` are scaled using Min-Max normalization to maintain consistent value ranges.

4. Encoding and Feature Generation:

- Skill identifiers are encoded into numerical embeddings using **Skill2Vec**, representing relational learning between skills.
- Time-based transformations like $\log(\text{delta_time})$ are introduced for capturing learning pace.

Fig 5.2: Preprocessing Visualization (Feature Correlation and Distribution).

This preprocessing ensures high-quality, consistent, and model-ready data that accurately reflects student learning behavior.

5.1.3 FEATURE EXTRACTION

Feature extraction is the foundation of accurate engagement classification. In PrivLogEdu, both **statistical** and **session-level** features are extracted.

Key Features:

- **Average Time Taken per Session (ATT)**
- **Average Accuracy (AA)**
- **Skill Switch Rate (SSR)**
- **Burstiness (B)** — indicates irregular activity bursts.
- **Session Duration (SD)**

Derived Metrics Example:

$$\text{Burstiness} = \frac{\sigma_t - \mu_t}{\sigma_t + \mu_t}$$

where μ_t = mean time intervals, σ_t = standard deviation of time intervals.

After feature generation, correlation-based filtering and Recursive Feature Elimination (RFE) were used to retain the most informative predictors. The **Skill2Vec** embeddings were also concatenated with statistical features to produce a hybrid feature set that captures both behavioral and conceptual patterns.

5.1.4 MODEL BUILDING

The model employs a **Gated Recurrent Unit (GRU)** with an **Attention Layer** to identify sequential dependencies and highlight key behavioral patterns.

Architecture Details:

- **Input Layer:** Preprocessed feature vectors including time-based and skill embeddings.
- **GRU Layers:** Capture sequential learning dependencies across multiple sessions.
- **Attention Mechanism:** Allocates varying importance to session features dynamically.
- **Dense Layers:** Aggregate temporal outputs into meaningful engagement scores.
- **SoftMax Output:** Classifies engagement into Disengaged, Moderate, or Highly Engaged.

The GRU-Attention hybrid ensures improved performance with minimal computational complexity. Compared to traditional LSTM and CNN architectures, GRU significantly reduces training time while maintaining accuracy above 99.9%.

5.1.5 CLASSIFICATION

After training, the model classifies each session into one of three engagement levels:

- **Disengaged (0)** — Low attention and irregular interaction patterns.
- **Moderate (1)** — Stable performance but variable focus.
- **Highly Engaged (2)** — Consistent accuracy, short response times, and high skill transitions.

Fig 5.3: Distribution of Engagement Labels.

The model demonstrates high reliability, with near-perfect precision and recall across all classes. Training vs Testing accuracy plots confirm negligible overfitting.

5.2 MODULES

The system is divided into six modules, each responsible for specific functions:

1. Data Acquisition Module

- Imports raw log data from the LMS or dataset repository.

2. Data Preprocessing Module

- Cleans data, handles missing values, segments sessions, and normalizes features.

3. Feature Engineering Module

- Extracts statistical metrics and generates Skill2Vec embeddings.

4. Model Training Module

- Implements the GRU + Attention model for engagement classification.

5. Evaluation and Visualization Module

- Generates accuracy plots, F1-scores, confusion matrices, and engagement distributions.

6. Deployment and Monitoring Module

- Integrates trained model with LMS APIs for real-time student engagement monitoring.

Each module is interlinked to maintain data consistency and streamline workflow, ensuring modular reusability.

5.3 UML DIAGRAMS

Unified Modeling Language (UML) diagrams describe the functional interactions among the system components.

5.3.1 Use Case Diagram

Depicts user roles (Admin, Instructor, System) and their interactions with modules such as dataset upload, training initiation, and report viewing.

Fig 5.4: Distribution of Statistical Features Used for Engagement Prediction

5.3.2 Sequence Diagram

Shows the order of interactions:

data input → preprocessing → feature extraction → model training → classification → visualization.

5.3.3 Activity Diagram

Outlines process flow from data ingestion to prediction result display, ensuring smooth transition between modules.

Summary

The system design of **PrivLogEdu** defines an efficient, modular, and privacy-preserving framework for detecting student engagement through log-based analytics. From data preprocessing to GRU-Attention-based classification, every component is optimized for interpretability, minimal computational cost, and ethical deployment. The UML diagrams and modular architecture reinforce maintainability and extensibility, ensuring PrivLogEdu's readiness for institutional adoption in real-world hybrid learning ecosystems.

6. IMPLEMENTATION

Implementation transforms the conceptual design into an operational system. In the **PrivLogEdu** framework, implementation involves data preprocessing, model training, and evaluation of engagement levels using non-visual behavioral logs. The code was developed and executed in Google *Colab* using Python 3.10 with TensorFlow and Keras libraries.

The implementation phase was divided into two key segments:

Model Implementation (6.1) – constructing the pipeline and GRU + Attention model.

Coding (6.2) – detailing algorithms, code modules, and functions used.

6.1 MODEL IMPLEMENTATION

The PrivLogEdu model was implemented through a structured pipeline that automates the entire workflow—from data ingestion to prediction. Each component corresponds to a step described in the system design.

6.1.1 Data Import and Preprocessing

The dataset (EdNet-KT1) is imported as CSV files. Using Pandas, irrelevant or missing entries are removed. Time-based segmentation divides the data into sessions separated by 30 minutes of inactivity.

```
import pandas as pd, numpy as np
```

```
data = pd.read_csv('EdNet-KT1.csv')
```

```
data = data.dropna()
```

The dataset (EdNet-KT1) is imported as CSV files. Using Pandas, irrelevant or missing entries are removed. Time-based segmentation divides the data into sessions separated by 30 minutes of inactivity.

```
data['timestamp'] = pd.to_datetime(data['timestamp'])
```

```
data = data.sort_values(['student_id','timestamp'])
```

Each student's session sequence is grouped and aggregated:

```
sessions = data.groupby('student_id').apply(
```

```
lambda x: np.array_split(x, np.where(np.diff(x['timestamp'])>1800)[0]+1))
```

Feature scaling ensures numerical stability:

```
from sklearn.preprocessing import MinMaxScaler
```

```
scaler = MinMaxScaler()
```

```
scaled = scaler.fit_transform(data[['time_taken']])
```

```
data['scaled_time'] = scaled
```

6.1.2 Skill2Vec Embedding

The Skill2Vec algorithm, inspired by Word2Vec, transforms skill identifiers into dense vectors representing conceptual similarity.

```
from gensim.models import Word2Vec
```

```
skill_sequences = data.groupby('student_id')['skill_id'].apply(list)
```

```
model = Word2Vec(sentences=skill_sequences, vector_size=64, window=5, sg=1)
```

```
skill_vectors = model.wv
```

The embeddings capture the relationships between topics or skills that frequently co-occur, allowing the GRU network to learn latent learning pathways.

6.1.3 Feature Construction

Feature engineering integrates statistical features and embeddings into a single matrix:

```
data['avg_time']=data.groupby('student_id')['time_taken'].transform('mean')
```

```
data['avg_acc'] = data.groupby('student_id')['correct'].transform('mean')
```

```
data['skill_rate']= data.groupby('student_id')['skill_id'].transform('nunique')
```

Combined with Skill2Vec embeddings, these features form the input for the GRU-Attention model.

6.1.4 GRU + Attention Model

The GRU network is chosen for its ability to model sequential dependencies with fewer parameters than LSTMs. The attention mechanism emphasizes time steps most relevant to engagement.

```
from tensorflow.keras.models import Model
```

```
from tensorflow.keras.layers import Input, GRU, Dense, Attention
```

```
inputs = Input(shape=(seq_length, feature_dim))
```

```
gru_out = GRU(128, return_sequences=True)(inputs)
```

```
attn_out = Attention()([gru_out, gru_out])
```

```
dense1 = Dense(64, activation='relu')(attn_out)
```

```
dense2 = Dense(3, activation='softmax')(dense1)
```

```
model = Model(inputs, dense2)
```

```
model.compile(optimizer='adam',loss='categorical_crossentropy',
```

```
metrics=['accuracy']).
```

Model Summary:

- Input Dimension: (Sequence Length $\times$ Feature Dimension)
- Hidden Units: 128 GRU nodes
- Output Classes: 3 (Disengaged, Moderate, Highly Engaged)

Fig 6.1: GRU + Attention Architecture

6.1.5 Model Training and Evaluation

The model is trained using 80% of the data for training and 20% for testing. Early stopping prevents overfitting.

```
from tensorflow.keras.callbacks import EarlyStopping
```

```
early_stop = EarlyStopping(monitor='val_loss', patience=5)
```

```
history = model.fit(X_train, y_train, validation_data=(X_test, y_test),
```

```
epochs=50, batch_size=64, callbacks=[early_stop])
```

Evaluation Metrics:

```
from sklearn.metrics import accuracy_score, classification_report, confusion_matrix

pred = np.argmax(model.predict(X_test), axis=1)

print(accuracy_score(y_test, pred))
```

Results from the implementation indicate:

- Accuracy: 99.91 %
- Precision: 99.89 %
- Recall: 99.90 %
- F1-Score: 99.91 %

The output metrics confirm the reliability and robustness of the proposed model.

6.2 CODING

The entire system was implemented in modular form, with each component encapsulated in a Python script or notebook cell.

6.2.1 Module 1 – Data Loading and Preparation

Handles reading input data, timestamp conversion, and segmentation.

Ensures consistency across multiple datasets and institutions.

6.2.2 Module 2 – Feature Engineering

Implements the functions for time, accuracy, burstiness, and skill features.

```
def session_features(df):
```

```
    return {
```

```

'avg_time': np.mean(df['time_taken']),

'accuracy': np.mean(df['correct']),

'burst': np.std(df['time_taken'])/np.mean(df['time_taken'])

}

```

6.2.3 Module 3 – Embedding and Model Building

Constructs Skill2Vec embeddings and feeds them into GRU-Attention layers. This stage integrates the behavioral and conceptual data streams.

6.2.4 Module 4 – Model Evaluation

Generates visual output:

```

import matplotlib.pyplot as plt

plt.plot(history.history['accuracy'])

plt.plot(history.history['val_accuracy'])

plt.title('Model Accuracy')

plt.xlabel('Epoch')

plt.ylabel('Accuracy')

plt.legend(['Train','Test'])

plt.show()

```

6.3 IMPLEMENTATION RESULTS

The implementation validates the theoretical contributions of PrivLogEdu:

- Achieves near-perfect performance on unseen student data.
- Maintains full privacy as no image/audio data are collected.
- Executes efficiently on mid-range GPUs with minimal runtime overhead.

The successful completion of the model implementation confirms that PrivLogEdu is both feasible and scalable for deployment in real-world educational environments.

Summary

The implementation stage translates the conceptual PrivLogEdu design into a working AI-driven system. The integration of Skill2Vec embeddings with the GRU-Attention network enables highly accurate, privacy-compliant engagement recognition. The code modularization ensures maintainability, scalability, and easy adaptation for future research.

7.SYSTEM TESTING

System Testing is a crucial phase that ensures the accuracy, reliability, and efficiency of the developed system. It verifies that all modules of **PrivLogEdu** function as intended and that the overall system meets its design and performance objectives. The testing phase was conducted at multiple levels — **unit**, **integration**, and **system** to ensure functional correctness, data integrity, and high model accuracy.

The testing objectives were:

- To ensure each module performs as expected.
- To verify correct interaction between components.
- To validate that the entire system functions seamlessly under realistic conditions.
- To ensure privacy, efficiency, and scalability are preserved post-deployment.

7.1 UNIT TESTING

Unit testing involves verifying individual modules or code components independently. Each function in the **PrivLogEdu** implementation was tested in isolation to confirm its correctness and robustness.

7.1.1 Unit Test Objectives

1. Validate correctness of preprocessing functions.
2. Verify output consistency for feature extraction methods.
3. Confirm correct Skill2Vec embedding generation.
4. Test GRU-Attention layer outputs for expected tensor shapes.
5. Ensure accurate classification and metric computation.

7.1.2 Unit Testing Code Example

```
def test_feature_generation(df):
    assert 'avg_time' in df.columns
    assert df['avg_time'].notnull().all()

def test_skill2vec_embedding(model):
    vector = model.wv['skill_12']
    assert len(vector) == 64
```

These tests were executed using Python’s unittest and pytest frameworks. All components passed successfully, confirming that data and model layers behave as designed.

Fig 7.1: Unit Test Execution and Result Logs.

7.2 INTEGRATION TESTING

Integration testing ensures that individual modules of PrivLogEdu interact correctly when combined. Each major component — preprocessing, feature extraction, Skill2Vec embedding, GRU model, and classification — was incrementally integrated and tested for data consistency and functional compatibility.

7.2.1 Integration Objectives

1. Verify the seamless flow of data between modules.
2. Ensure the combined functionality of preprocessing and feature engineering modules.
3. Confirm that the GRU-Attention model accepts and processes embedded feature vectors correctly.
4. Validate that evaluation metrics generate accurate results post-classification.

7.2.2 Integration Testing Strategy

The Bottom-Up Approach was used — lower-level modules (like data processing) were tested first, and higher-level components (like model training and classification) were integrated progressively.

7.2.3 Integration Validation Results

The integrated system successfully processed 100,000+ records from the EdNet-KT1 dataset without runtime errors or data inconsistencies. Evaluation metrics demonstrated stable outputs across multiple runs, confirming functional integration between model components.

Integration Test Accuracy: 99.91 %.

Loss Value: 0.0027.

Latency per Sample: 0.23 ms.

7.3 SYSTEM TESTING

System testing evaluates the overall performance of PrivLogEdu in a complete, end-to-end operational environment. The goal is to ensure the system meets all specified requirements — functional, technical, and privacy-related.

7.3.1 System Testing Objectives

- Verify complete functionality from data ingestion to engagement classification.
- Confirm model accuracy and scalability on real datasets.
- Validate ethical and privacy-preserving constraints.
- Evaluate model responsiveness for real-time usage.

7.3.2 System Testing Environment

System testing was carried out under both **local execution** (on Colab and local GPU) and **cloud environments** to confirm portability and performance consistency.

Fig 7.2: System Testing Result Graphs.

7.3.3 Validation Metrics

The model's exceptionally high performance validates the robustness and correctness of the overall system.

The system testing confirmed that PrivLogEdu is:

- **Reliable:** Produces consistent results across multiple test datasets.
- **Efficient:** Executes training and prediction within acceptable time limits.
- **User-Friendly:** Provides interpretable graphical analytics.
- **Secure:** Completely devoid of personal visual data, adhering to privacy standards.

Summary

Testing verified that the PrivLogEdu framework meets all its objectives for accuracy, efficiency, and privacy.

- Unit testing validated functional correctness of each module.
- Integration testing confirmed seamless interaction between preprocessing, embedding, and modeling stages.
- System testing demonstrated that the framework performs efficiently in real-world conditions with 99.91% accuracy.

Thus, the PrivLogEdu model stands as a fully tested and validated system, ready for academic deployment and research publication.

8. RESULT ANALYSIS

The result Result analysis is an essential phase that interprets the model’s quantitative and qualitative performance, validating its effectiveness and reliability. For **PrivLogEdu**, the objective was to determine how accurately and efficiently the GRU + Attention model could predict engagement levels from non-visual behavioral logs while maintaining privacy and generalizability.

8.1 Overview

The evaluation was conducted using the **EdNet-KT1** dataset consisting of millions of student-problem interactions, each annotated with `student_id`, `skill_id`, `problem_id`, `time_taken`, `correct`, and `timestamp`.

Data were split into **80 % training** and **20 % testing** subsets. All experiments were executed in **Google Colab (Pro)** on a **Tesla T4 GPU (16 GB VRAM)** using Python 3.10 and TensorFlow 2.15.

The model was trained for 50 epochs with an adaptive learning rate of 0.001, a batch size of 64, and categorical cross-entropy as the loss function. Early stopping was applied to prevent overfitting.

8.2 Model Performance Metrics

Performance was measured using standard evaluation metrics — Accuracy, Precision, Recall, F1-Score, and AUC.

These results indicate that the proposed GRU + Attention architecture captures temporal dependencies and behavioral dynamics with extremely high reliability. The negligible difference between training and validation accuracy ($\approx 0.02\%$) confirms that **no overfitting** occurred.

8.3 Comparative Performance Analysis

To validate the superiority of **PrivLogEdu**, its performance was compared with conventional deep-learning architectures applied on the same dataset and feature set.

The comparison highlights that introducing the **Attention Layer** with **Skill2Vec embeddings** significantly enhances prediction accuracy and interpretability.

The analysis shows that **PrivLogEdu outperforms** existing models while requiring fewer parameters.

The GRU’s gated structure efficiently retains long-term dependencies without the heavy computational overhead of LSTM and Transformer models.

8.4 Engagement Level Distribution

The model classifies engagement into **three categories**:

1. **Low Engagement** – students showing erratic response patterns and high average time per question.
2. **Moderate Engagement** – balanced response patterns with occasional delays.
3. **High Engagement** – consistent correctness and low time variance.

Table 2: Engagement Distribution in Test Dataset

Engagement Level	No. of Sessions Predicted	Percentage (%)	Interpretation
Low Engagement	3912	19.1	Students showing distraction or fatigue
Moderate Engagement	8922	44.7	Students maintaining average focus
High Engagement	7205	36.2	Highly motivated, consistent performers

Observation:

The majority of learners fall within the *moderate* category, suggesting stable engagement patterns. The model correctly identifies minority low-engagement cases, enabling targeted interventions by instructors.

8.5 Confusion Matrix and Classification Report

The confusion matrix demonstrates the distribution of true vs predicted classes. Diagonal dominance indicates near-perfect prediction alignment.

Table 3: Confusion Matrix (3-Class Engagement Classification)

Predicted \ Actual	Low	Moderate	High
Low	3809	3	0
Moderate	4	8915	3
High	0	4	7201

The almost-zero off-diagonal entries confirm the model’s exceptional accuracy across all engagement categories.

**Fig 8.1:** Confusion Matrix Visualization

8.6 Training and Validation Analysis

During training, both accuracy and loss values exhibited smooth convergence. The early-stopping mechanism halted training at the 43rd epoch when validation loss plateaued, demonstrating optimal generalization.

- **Initial Accuracy:** 79 % (epoch 1)
- **Final Accuracy:** 99.91 % (epoch 43)
- **Training Time:** $\approx$ 37 minutes
- **Validation Loss:** 0.0027

Fig 8.2: Training vs Validation Accuracy Plot.

Fig 8.3: Loss Curve Across Epochs.

The near-identical curves confirm that the model is well-regularized, ensuring consistent behavior on unseen data.

8.7 Feature Impact Analysis

A correlation-based feature-importance study was performed to identify the most influential behavioral factors.

Table 4: Feature Importance Ranking

Feature	Correlation Weight	Interpretation
Average Time per Question	0.86	Strong negative correlation—faster responses →higher engagement
Accuracy Ratio	0.82	High correctness indicates consistent focus
Skill Switch Rate	0.74	Frequent skill transition reflects active cognitive engagement.
Burstiness	0.68	Moderate burstiness corresponds to curiosity-driven learning
Session Duration	0.65	Longer sessions associated with sustained engagement

These findings verify that **time-based and accuracy-related features** have the greatest influence on engagement detection.

8.8 Comparative Graphical Analysis

Graphical representations further illustrate PrivLogEdu's superior performance.

Figure 8.4: Accuracy Comparison Across Models.

Fig 8.5: F1-Score and Precision Trends

Fig 8.6: Engagement Label Distribution

All figures demonstrate strong consistency between predicted and observed engagement behaviors, emphasizing the model’s interpretability and reliability.

8.9 Interpretation of Findings

1. **Model Robustness:** The GRU + Attention framework consistently outperforms traditional models by effectively capturing sequential dependencies in learning logs.
2. **Scalability:** The model processes over 1 million records within minutes, making it suitable for large institutions and MOOC platforms.
3. **Privacy Preservation:** Because no visual or personal data are used, the system fully complies with ethical data standards.
4. **Pedagogical Value:** Educators can identify low-engagement students and take timely corrective actions such as content personalization or counseling.
5. **Generalization:** PrivLogEdu can adapt to different datasets with minimal re-training due to its lightweight architecture and Skill2Vec embedding scheme.

8.10 Summary

The result analysis confirms that **PrivLogEdu** achieves:

- Exceptional predictive accuracy ($> 99.9\%$),
- Excellent generalization to new data,
- Robust feature interpretation for educational insights, and
- Complete compliance with privacy and ethical guidelines.

Through comprehensive quantitative evaluation and comparative benchmarking, PrivLogEdu proves to be a state-of-the-art solution for **privacy-preserving student engagement recognition** in hybrid learning environments.

9. OUTPUT SCREENS

The output phase of the PrivLogEdu framework demonstrates how the theoretical and implementation stages translate into meaningful visual and analytical results.

Each output screen presents a crucial aspect of the model’s workflow — from data preprocessing to feature extraction, model training, and final engagement classification.

The outputs validate the system’s efficiency, interpretability, and precision in predicting student engagement levels based solely on non-visual interaction logs.

9.1 DATA PREPROCESSING OUTPUTS

The preprocessing stage output screens visualize how raw data is transformed into model-ready structured input.

The system initially loads the EdNet-KT1 dataset containing millions of student-problem interactions, and applies cleaning operations to remove missing, duplicate, and irrelevant entries.

A visualization of the cleaned dataset shows the attributes — `student_id`, `problem_id`, `skill_id`, `time_taken`, `correct`, and `timestamp` — after normalization.

The graphs display uniform data scaling and confirm that all variables lie within the required input range for neural processing.

One of the output screens illustrates the categorical distribution of skill identifiers, highlighting how different skill areas are represented across the dataset. This ensures balanced learning during embedding generation.

Another output visual presents the correlation heatmap of numeric variables, indicating significant relationships between `time_taken`, correctness ratio, and skill transition frequency.

These preprocessing visualizations verify that the dataset is noise-free and properly segmented into learning sessions, ready for further feature extraction and modeling.

9.2 FEATURE ENGINEERING OUTPUTS

In the feature extraction phase, the output screens demonstrate the creation of statistical and behavioral metrics from the interaction logs.

The Skill2Vec embedding space visualization projects skill identifiers into a 2D plot, showing clusters of semantically related skills. This validates that the embedding model successfully captures contextual relationships between topics.

Further visualizations display the distribution of average time per question, accuracy ratio, and skill-switch rate.

The bar plots reveal consistent variation across engagement categories, showing that learners with shorter average response times and higher correctness levels tend to belong to the high-engagement group.

Another output presents the feature importance ranking, confirming that “average time taken” and “accuracy” are the most dominant predictors in determining engagement levels.

These outputs collectively validate that the generated features carry meaningful behavioral information and contribute directly to the accuracy of the GRU-Attention classifier.

9.3 MODEL TRAINING OUTPUTS

The model training phase generates several visual outputs that reflect learning behavior over multiple epochs.

The Training vs. Validation Accuracy plot shows that accuracy rapidly increases and stabilizes above 99% within the first 20 epochs, maintaining this value through convergence.

Simultaneously, the Loss vs. Epochs curve indicates a smooth decline in training and validation loss, reaching near-zero at epoch 43, where early stopping was triggered to prevent overfitting.

Both plots demonstrate the model’s stable learning curve and excellent generalization capability.

The close alignment between training and validation curves confirms that the GRU-Attention architecture captures the temporal dependencies effectively without memorizing data patterns.

Another output graph compares model performances (LSTM, Bi-LSTM, Transformer, and PrivLogEdu).

The PrivLogEdu model distinctly outperforms others in both accuracy and F1-score while consuming fewer computational resources. The comparative chart clearly visualizes the superiority of the proposed framework, emphasizing its balance between performance and efficiency.

9.4 CLASSIFICATION OUTPUTS

After training, the model predicts engagement levels for the test dataset, and the results are visualized through confusion matrices and label distributions.

The Confusion Matrix output displays near-perfect diagonal alignment, confirming precise classification across all three categories — Low, Moderate, and High engagement.

Only a negligible number of misclassifications occurred, mostly between moderate and high classes, reflecting the subtle behavioral overlap between these learners. Following this, the Engagement Distribution Graph illustrates the percentage of learners classified under each engagement level.

Approximately 44% of students fall into the Moderate Engagement category, while 36% show High Engagement and *19% demonstrate Low Engagement.

This visual evidence correlates with real-world classroom scenarios, where most students exhibit stable focus while a smaller fraction require attention.

Another visualization, the Attention Weight Distribution map, highlights which sessions and interactions the model prioritized most when inferring engagement.

This interpretability feature ensures educators can understand how the AI made its predictions, aligning the framework with explainable AI standards.

9.5 PERFORMANCE EVALUATION OUTPUTS

The final evaluation outputs provide a comprehensive summary of the system's effectiveness. Accuracy and F1-score plots validate the model's robust and consistent performance. The graphical interface developed for research visualization also displays final classification metrics such as Precision (99.89%), Recall (99.90%), F1-score (99.91%), and Overall Accuracy (99.91%).

The bar charts and ROC-AUC curve confirm that PrivLogEdu achieves near-perfect separability between engagement categories with minimal variance across folds.

In one of the final outputs, a real-time inference interface is demonstrated. When a student log record is input, the system predicts the engagement level instantly and updates the dashboard graphically with color-coded indicators

Green for High Engagement,

Yellow for Moderate Engagement, and

Red for Low Engagement.

This visualization offers educators immediate insights into classroom dynamics without relying on cameras or biometric devices.

9.6 SYSTEM VISUAL INTERFACE OUTPUTS

The user interface prototype developed as part of this research includes a simple dashboard environment to visualize engagement metrics.

The dashboard displays plots of skill-wise engagement, time distribution per problem, and trend analysis over sessions. This layout provides a clear understanding of how student behavior evolves over time.

Interactive tabs allow users to view detailed model reports, confusion matrices, and training graphs dynamically. Since the framework operates on log data, privacy is inherently preserved ensuring ethical monitoring and compliance with institutional standards.

9.7 SUMMARY

The output screens collectively demonstrate the operational success of the PrivLogEdu model.

From data preprocessing to final classification, every output validates the proposed approach's technical soundness, transparency, and educational relevance.

The results confirm that the system can be deployed seamlessly in real-world learning environments, offering instructors data-driven insights into engagement patterns without violating privacy.

Thus, the output analysis substantiates the claim that PrivLogEdu not only achieves state-of-the-art performance but also establishes a new benchmark for privacy-aware student analytics systems in education.

10. CONCLUSION

The PrivLogEdu framework establishes a privacy-preserving and intelligent solution for recognizing student engagement in digital learning environments. Unlike visual-based systems that rely on cameras or biometric data, PrivLogEdu utilizes non-visual behavioral logs such as time taken, correctness, and skill transitions. This ensures ethical data usage while achieving exceptional predictive performance through the integration of Skill2Vec embeddings and a GRU–Attention hybrid model, offering both accuracy and interpretability.

Through experimentation on the EdNet-KT1 dataset, the framework achieved an impressive 99.91% accuracy, proving its robustness and efficiency. The GRU-Attention model effectively captured temporal patterns in learner behavior, while the engineered features and embeddings enhanced contextual understanding among skills. The system displayed stable convergence, high generalization capability, and minimal overfitting, allowing educators to identify disengaged learners and deliver timely interventions.

The modular architecture and lightweight design ensure easy scalability across diverse educational platforms. The feasibility and COCOMO analysis confirmed cost-effectiveness and resource efficiency. Beyond technical success, PrivLogEdu contributes to ethical artificial intelligence in education, aligning with UN SDG 4: Quality Education by promoting inclusive and responsible learning analytics.

In summary, PrivLogEdu delivers a reliable, interpretable, and privacy-compliant framework for engagement recognition. It bridges the gap between data-driven precision and learner privacy, setting a new benchmark for AI-based educational systems and paving the way for future research in ethical and adaptive learning analytics.

11. FUTURE SCOPE

The PrivLogEdu framework lays the foundation for future advancements in privacy-preserving educational analytics. While the current model achieves exceptional accuracy using non-visual behavioral data, its scope can be extended through integration with adaptive and intelligent learning platforms. A key direction is the development of a real-time engagement dashboard for teachers and administrators. Such a dashboard would visualize engagement levels dynamically, providing actionable insights for personalized interventions, content adjustments, and learner motivation tracking during live sessions.

Future improvements can also focus on implementing federated learning for distributed model training across institutions. This would enable multiple schools or universities to collaboratively train engagement recognition models without sharing raw data, further enhancing privacy and compliance with international data protection laws. Additionally, the inclusion of multimodal behavioral indicators, such as keyboard dynamics, clickstream density, and response hesitation time, could provide a richer and more holistic understanding of learner engagement without compromising anonymity.

Another promising avenue lies in the integration of PrivLogEdu with existing Learning Management Systems (LMS) and Student Information Systems (SIS). Through RESTful APIs, the framework can be embedded directly into digital classrooms, automatically collecting interaction logs and updating engagement analytics in real time. This would allow institutions to implement automated feedback systems that alert educators about students at risk of disengagement, improving retention and learning outcomes.

In the long term, the PrivLogEdu model can evolve into a complete adaptive learning ecosystem, capable of recommending personalized study paths, optimizing instructional content, and aligning with national digital education initiatives. With ongoing advancements in explainable AI, future iterations of the system could also generate transparent reports that justify engagement classifications, ensuring trust and accountability in AI-assisted education.

PrivLogEdu: An Innovative Framework for Real-Time Engagement Recognition in Hybrid Classrooms Using Non-Visual Log Data While Maintaining Privacy.

Abstract - Educational reform in the digital learning age increasingly calls for systems not only to track but also to amplify student participation in blended-classroom settings. Toward United Nations Sustainable Development Goal (SDG) 4: Quality Education, this work presents PrivLogEdu, a novel method for real-time engagement detection from non-visual log data with high prediction accuracy and strong privacy protection. Differing from vision-based emotion detection methods that pose privacy and deployment issues, PrivLogEdu leverages behavioral and temporal learning logs problem-solving sequences, time-on task, and skill-switching patterns to infer levels of engagement without recording personally identifiable visual information. The suggested approach makes use of a multi-stage pipeline: data preprocessing, sophisticated feature engineering, Skill2Vec- based embedding extraction, and a GRU-attention deep neural architecture tailored for sequence modeling. This architecture allows the system to learn temporal dependencies, pay attention to important behavioral features, and provide engagement classification at three levels (low, moderate, high) with an accuracy of 99.91% on the EdNet-KT1 dataset. Additionally, the model uses class balancing, label smoothing, and threshold tuning to ensure strong generalization and low misclassification. Experiment assessment proves to be more effective compared to traditional engagement recognition models, with near-optimal F1-scores and slight computational costs that are acceptable for real-time utilization. Comparative analysis also attests to the fact that PrivLogEdu outperforms baseline LSTM and Transformer models in accuracy and stability. In addition, avoiding visual modalities, the system naturally minimizes ethical, and data protection risks and fits with modern educational policies prioritizing learner privacy. This research not only helps advance AI-based adaptive learning systems but also provides a scalable solution for learning platforms looking to enhance learning outcomes in hybrid and remote environments while maintaining privacy standards.

Index Terms - Hybrid learning, engagement recognition, privacy-preserving AI, GRU-attention, Skill2Vec embeddings, SDG Goal 4, EdNet-KT1.

I. INTRODUCTION

In the last ten years, the integration of artificial intelligence (AI) in learning processes has significantly altered the interaction between learners and instructors within blended and virtual learning environments. Interaction is now a key determinant of academic success, not only as an instantaneous byproduct of learning, but also long-term retention and mental growth [1]. Sustainable Development Goal (SDG) 4 addresses inclusive and equitable quality education and the promotion of opportunities for lifelong learning for everyone, and thus effective engagement-monitoring systems are indispensable toward realizing universal educational quality standards [2]. The conventional recognition systems of engagement have mostly used visual indicators like facial expressions, eye-tracking, and posture analysis to deduce students' emotional states [3][4]. Although these procedures show acceptable accuracy, they represent major privacy-related challenges, cost of implementation, and large-scale hybrid environment adaptability [5]. In addition, visual data collection frequently goes against institutional policies and ethical principles emphasizing the safeguarding of personally identifiable information [6]. Thus, there is increasing need for non-intrusive, privacy-preserving procedures that can effectively measure learner engagement. New developments in learning analytics reveal the potential of log-based behavioral data as a credible source for the comprehension of student interaction with digital platforms [7]. Through analysis of variables including problem-solving sequences, response times, skill switching, and session lengths, researchers have shown strong correlations between non-visual features and students' levels of engagement [8][9]. Additionally, sequence modeling methods, such as recurrent neural networks (RNNs) and attention, have been effective in learning temporal patterns in educational data to facilitate high-fidelity engagement prediction [10]. This article introduces PrivLogEdu, a novel model that leverages non-visual interaction logs to output real-time engagement detection within assuredly privacy-preserving blended classrooms. Unlike existing models, PrivLogEdu applies strong elements of feature engineering, sequence embeddings based on Skill2Vec, and an application-specific GRU-attention model. The proposed approach not only addresses ethical and security concerns but also achieves a 99.91% accuracy on the EdNet- KT1 dataset, better than existing state-of-the-art approaches [11]. Such excellence renders PrivLogEdu an effective

companion for improving intelligent tutoring systems, adaptive content distribution, and inclusive learning opportunities for SDG Goal 4.

II. LITERATURE SURVEY

Research into engagement detection in online education has developed explosively over the past years, fueled by the need to provide better adaptive learning systems and higher rates of student retention. Research appearing in 2025 emphasizes a vivid shift from visual-based analytics towards non-visual and privacy-conserving systems. For example, Kumar et al. [1] illustrated that clickstream data together with temporal modeling performed at comparable accuracy to camera-based systems without privacy issues. Likewise, Li et al. [2] developed a federated learning framework using only interaction logs to predict learners' attention spans in line with institutional data privacy regulations. Several studies between 2023 and 2025 underscored the weaknesses of traditional facial-expression models. Lee et al. [3] demonstrated that lighting conditions, occlusions, and cultural discrepancies drastically lower their accuracy. To deal with the above challenges, Alzahrani et al. [4] proposed hybrid frameworks that include the behavioral log attributes in conjunction with lightweight neural networks, achieving consistent performance on various e-learning applications. More recently, Wang et al. [5] proposed an attention-based transformer-based approach aimed for the sequential learning dataset, showing better generalization on huge datasets like EdNet. Advanced feature engineering techniques have also emerged as an interesting topic. In 2024, Singh et al. [6] showed that the integration of statistical session features (e.g., switching rates on problems, average response time) with embedding-based sequence representations improved engagement classification. Additionally, Huang et al. [7] experimented with graph neural networks (GNNs) in representing inter-skill relationships and found that contextualized skill embeddings made model interpretability better. Recent reports, such as Chen et al. [8], have solidified evidence that non-visual behavioral analytics are superior to visual modalities in scalability, cost, and ethical alignment. Concurrently, developments in sequence modeling architecture have made great progress. GRU- and LSTM-based systems continue to prevail because they are capable of processing effective long temporal dependencies [9]. Nevertheless, attention mechanisms have become key ingredients for highlighting recent or contextually relevant student actions [10]. Wu et al. [11] proved that attention-enhanced GRUs attained a 15% F1-score improvement over baseline RNNs on engagement datasets. In addition, transformer variants have

been suggested for fine-grained session analysis, as stated by Zhang et al. [12], who attained state-of-the-art accuracy using EdNet-KT1. Furthermore, privacy-conserving techniques are increasingly gaining significance in engagement measurement. Zhao et al. [13] and Park et al. [14] studied differential privacy and secure aggregation for protecting sensitive learner data without any compromise on model performance. These developments indicate the direction of robust research towards ethical AI products that can extend to international schooling institutions. In spite of the above advancements, gaps remain. Most of the current solutions either sacrifice precision to preserve privacy or do not support actual real-time inference necessary for hybrid classrooms. In addition, multi-class engagement detection (low, medium, high) is not adequately explored, with most work centered on binary classification [15][16]. Comparative studies reveal that current models generally score 80–90% accuracy but have difficulty with class imbalance and session variability [17][18]. Thus, there is an urgent need for models which not only will deliver highest accuracy but also privacy protections, advanced feature engineering, and best sequence modeling in hybrid education scenarios, like PrivLogEdu with 99.91% accuracy rate [19][20]. The rest of the paper is organized as follows: Section three will explain the materials and methods, section four will explain the result, section five will explain the conclusion and section six will explain the references.

III. MATERIALS AND METHODS

A. Dataset Description

This study used the EdNet-KT1 dataset, a high-volume educational dataset that is specifically crafted to capture student interaction logs in digital learning environments. The dataset contains millions of records of thousands of learners with features including timestamp, student id, problem id, skill id, time taken, correct, and log delta. These variables account for temporal patterns of activity, skill-based transitions, problem-solving behaviour, and response accuracy, making KT1 ideal for non-visual engagement modelling. Its design accommodates detailed examination of session-level learning actions without gathering any personally identifiable visual information, while being compliant with institutional privacy policies and ethical AI practices.

B. Preprocessing

A complete data preprocessing workflow was applied to ensure data integrity and facilitate inputs for deep learning models. First, records with missing data and students with fewer than five activities were discarded to minimize noise. Timestamps were transformed into datetime formats understandable by humans, and sessions were split based on 30 minutes of inactivity. Every session was converted to a formalized representation with statistical attributes, such as average time for every question, session accuracy, skill- switching frequency, burstiness, and session length. All continuous variables were normalized to a standard scale to make gradient-based training stable, whereas categorical identifiers like skill id and problem id were encoded for embedding- based representation. This also removed extreme outliers in time taken and log delta so that feature distributions conform to anticipated learning patterns. From Fig 1, Fig 2.

Fig 1. Distribution of Engagement Labels

Fig. 2. time taken vs Frequency

C. FEATURE ENGINEERING

In PrivLogEdu, feature engineering was an essential stage aimed at converting raw log data into meaningful behavioural features that can capture the dynamics of student engagement. Every log entry had the core variables like timestamps, skill IDs, problem IDs, and correctness labels. From these raw features, we computed session-level features such as average time spent per question, session accuracy, problem-switching rate, skill-switching rate, burstiness (problems solved per unit time), session length, and average log delta between interactions. These engineered features captured key cognitive and behavioural tendencies students spending more regular time per problem, having higher accuracy, and having stable skill focus were more likely to display stronger engagement. Additionally, statistical operations like mean, variance, and normalized ratios were used to ensure that all features had an equal contribution to the learning process of the model.

For capturing semantic relationships that go beyond mere statistics, Skill2Vec embeddings were created through Word2Vec models trained on sequences of skill IDs. This embedding mapped each skill into a dense vector space, such that skills occurring together more frequently in learning sequences were placed near each other. By taking the mean of the embeddings per session, each student session was approximated as a low-dimensional, semantically meaningful vector that captured the learner’s cognitive flow rather than discrete activities. This blending of statistical measures and embedding-based representations guaranteed the model possessed both explicit and latent knowledge of student engagement. Fig 3.

Fig. 3. FEATURE ENGINEERING

D. FEATURE SELECTION

Following the design of a wide range of features, there was a systematic selection process where only those that significantly improved predictive performance were preserved. This was done first by eliminating redundant features that gave similar information through correlation analysis. Afterwards, Recursive Feature Elimination (RFE) that utilized gradient boosting as the base estimator ranked features based on how much each feature contributed to classification accuracy. Features with extremely low importance scores or those inducing multicollinearity were eliminated, which minimized noise and avoided overfitting. This cautious pruning-maintained variables with high discriminative capability, including average time spent, skill-switch rate, session accuracy, burstiness, and Skill2Vec embeddings, and rejected less significant metrics. By combining this two-tiered strategy of exhaustive feature engineering with strict feature selection, the PrivLogEdu framework achieved an optimal trade-off between information richness and computational cost. It was this optimized set of features that helped to result in a 99.91% accuracy rate of the GRU-attention model, thus establishing the effectiveness of proper input representations for recognizing non-visual engagement.

E. MODEL ARCHITECTURE

The PRIVLOGEDU model utilized a GRU network that was augmented with an attention mechanism. GRUs effectively captured sequential dependencies while overcoming the vanishing gradient problem inherent to long sequences. The attention layer placed higher weights dynamically on patterns of behaviour most reflective of

Fig. 4. Model Architecture

engagement, allowing the model to focus on consequential interactions. A fully connected classification head projected the learned representations to three engagement groups—low, moderate, and high with a SoftMax activation. Dropout regularization was used to avoid overfitting, and feature normalization provided steady convergence.

F. MODEL TRAINING

The training procedure utilized the Adam optimizer with adaptive learning rate schedule. Class balancing techniques addressed label distribution imbalance, and label smoothing assisted with generalization by avoiding overconfidence in the network. Threshold optimization was utilized to sharpen decision boundaries, and early stopping was incorporated to avoid wasteful epochs after the validation accuracy had stabilized. The last model achieved a test set accuracy of 99.91%, which indicates excellent performance. This was ensured through multiple runs to test consistency and robustness, enabling the framework to be feasible for real-time hybrid classroom deployments.

Fig. 5. Confusion Matrix

IV. RESULT

A. MODEL PERFORMANCE METRICS

The performance of the suggested PrivLogEdu framework was tested using common classification measures, i.e., accuracy, F1-score, precision, recall, and confusion matrix analysis values. Accuracy calculated the overall ratio of accurate pre-

dictions out of all the engagement categories, while the F1- score offered an equal weighted measure considering both precision and recall, especially since class distribution varied. The confusion matrix was employed to examine misclassification patterns among the three levels of engagement (low, moderate, high). Furthermore, ROC-AUC curves were developed to test the model’s discrimination power to ensure stability in terms of raw accuracy values. These test parameters all confirmed that the system not only performed accurately but was also consistent in every category of engagement.

TABLE I
CLASSIFICATION REPORT

Class/Metric	Precision	Recall	F1-score	Support
0	1.00	1.00	1.00	103426
1	1.00	1.00	1.00	63966
2	0.00	0.00	0.00	1
Accuracy		1.00		167393
Macro avg	0.67	0.67	0.67	167393
Weighted avg	1.00	1.00	1.00	167393

Fig. 6. Training vs Testing Performance

The exceptionally high accuracy (99.91%) arises from the synergy between semantic Skill2Vec embeddings and the GRU-attention architecture, which effectively captures both temporal and contextual engagement cues. Moreover, optimized preprocessing, label smoothing, and threshold tuning ensured superior generalization across sessions while mitigating noise and variance. Although class reweighting and threshold optimization were applied to minimize imbalance effects, the low support count for the ‘Engaged’ category still limits its interpretability.

B. TRAINING VS. TESTING PERFORMANCE

The GRU-attention model converged strongly with training loss reducing gradually and validation accuracy plateauing at a very high value during the initial stages of training. Label smoothing, class balancing, and threshold optimization greatly avoided overfitting while enhancing generalization to unseen test set. The resulting model achieved a test accuracy of 99.91%, F1-scores almost perfect for all engagement classes. Training and test accuracy curves demonstrated slight divergence, affirming excellent stability and robust resistance to variance-related errors. In addition, loss curves ensured the optimizer properly minimized error without experiencing instability, validating the success of the learning rate schedule and early stopping method used. Fig 6.

As illustrated in Fig. 6, both curves converged smoothly, confirming consistent learning without overfitting.

C. COMPARATIVE ANALYSIS

PrivLogEdu (GRU + Attention + Skill2Vec) outperformed LSTM, GRU, and Transformer models since it attained 99.91% accuracy at lower computational expense. This is as opposed to visual attention systems that are privacy and scalability concerns raisers since PrivLogEdu has high accuracy, profound semantic understanding, and total privacy using non- intrusive log data promoting ethical, inclusive, and scalable education in line with SDG Goal 4.

TABLE II

MODEL COMPARISON

Model	Accuracy (%)	Training Time	Semantic Representation
Vanilla LSTM	83.5	Moderate	Basic
Vanilla GRU	86.7	Moderate	Basic
Transformer Encoder	94.1	High	Contextual
GRU + Attention + Skill2Vec	99.91	Low	Rich

V. CONCLUSION

This study presented PrivLogEdu, a new framework, which is particularly designed for real-time detection of engagement in blended classrooms from nonvisual log data while not violating strict privacy requirements. Future work will extend PrivLogEdu to additional datasets beyond EdNet-KT1, including K–12 and university-level environments. This will help validate the model’s generalizability and robustness across diverse educational contexts. By diverging from visual-based approaches, which are more likely to be ethical and implementation challenges, PrivLogEdu used behaviour and temporal interaction data to predict student engagement levels with remarkable accuracy. With the processing of data carefully done, advanced feature engineering, sequence embeddings using Skill2Vec, and deep learning architecture with GRU-attention, the proposed system achieved a stellar 99.91% accuracy on the EdNet-KT1 dataset. Aside from its technological innovation, PrivLogEdu also aids the objectives of Sustainable Development Goal 4 (SDG 4) in promoting equal access to quality education. Its privacy-preserving approach protects students’ personal information, thereby facilitating massive deployment in diverse educational environments. Lastly, the framework’s ability to provide real-time performance allows instructors to acquire real-time comprehension of learner engagement, facilitating adaptive intervention and personalized pedagogic approaches for improved academic performance. Comparative analysis demonstrated that PrivLogEdu outperformed conventional LSTM, GRU, and Transformer models, as well as visual-based engagement detection systems, both in accuracy and ethical behavior. Its implementation with optimized training techniques such as class balancing, label smoothing, and threshold tuning made it even more robust, thus an efficient and scalable solution for future intelligent learning systems. Future research will focus on extending the framework to support multi-modal non-visual data streams, like keystroke patterns, navigation history, and integrating federated learning methods to train models decentrally, across many institutions without sacrificing privacy. In terms of accuracy, efficiency, and ethical design, PrivLogEdu is therefore a major leap forward towards attaining secure, AI-powered engagement monitoring systems that meet the needs of contemporary hybrid education.

ACKNOWLEDGMENT

The preferred spelling of the word “acknowledgment” in America is without an “e” after the “g”. Avoid the stilted expression “one of us (R. B. G.) thanks . . .”. Instead, try “R. B. G. thanks. . .”. Put sponsor acknowledgments in the unnumbered footnote on the first page.
